Buy Train Simulator: The Holiday Express. \$6.99. Add to Cart. [] Train Simulator: The Holiday Express is the newest addition to the rail driving simulator series. It's simple enough for beginners, and complex enough for the seasoned driver. While the open-world gameplay feels like a first-person shooter, the gameplay is really geared towards playing this in conjunction with other Train Simulator games. No need to fight with your copilot over who controls the train while you're going through tight turns in the tracks. Since you can't fire a gun, your only control is the in-car controls. The controls have been revised for this game. While the update for the original Train Simulator included minor gameplay changes and the addition of an autopilot, the Train Simulator: The Holiday Express includes over 50 new gameplay features and a huge update of the simulation and graphics. Some of these new features include: GPS enabled trains, track upgrades, traffic signs, train yards, train stations, bridges, tunnels, and even a train cemetery. This game is an excellent choice for those who like to add in more complex scenarios like trains leaving and entering a station, trains passing by tunnels, passing under a bridge, or driving along a series of tight curves. Prevalence and risk factors for unplanned extubations in a neonatal intensive care unit. To determine the prevalence of unplanned extubations in a neonatal intensive care unit (NICU) and to assess the risk factors for unplanned extubations. A prospective cohort study of 730 neonates who were admitted to a NICU. Unplanned extubations were defined as an extubation that was not preceded by a previously established criteria. The data were analyzed using SPSS software. Of the total 730 neonates, 38 (5.1%) experienced unplanned extubation. Of the 38 unplanned extubations, 19 (50%) were re-intubated within 24 hours after the index extubation. The most common diagnosis was hypoxic ischemic encephalopathy (18 of 38, 47%), and birth weight less than 1,500 g (18 of 38, 47%). The unplanned extubation rate was 5.2% in term neonates and 10.9% in preterm neonates. The majority of unplanned extubations (59%) occurred within 48 hours after the index extubation. Unplanned extubations were more common in the less stable neonates. The unplanned extub 82157476af
